

## REFURBISHMENT

Our experienced team of engineers are able to extend the life of existing test chambers by offering upgrades or a complete refurbishment, not only of Design Environmental chambers but chambers of almost any manufacture.

An initial free of charge appraisal will be followed by advice on a suitable upgrade path and a detailed quotation. If upgrade or refurbishment is not cost effective then no quotation will be offered and disposal recommended.

- Simple controller upgrade to provide more accurate user friendly control of temperature and humidity and improved data acquisition capabilities.
- Refrigeration system upgrade to replace refrigeration gases to comply with the Montreal Protocol for ozone depleting gases.
- Complete refrigeration plant and control system replacement to provide improved performance, add humidity control or to make the chamber more serviceable and reliable.
- All work is covered by warranty and UKAS traceable calibration certificates are provided.

## DISPOSAL

If it is not cost effective to refurbish a chamber our service engineers are fully trained and qualified in the safe handling of refrigerants. Design Environmental are licensed to handle and then dispose of refrigerant through an authorised agent.

After safe removal of the refrigerant gas the chamber body can be disposed of by conventional means.

## RELOCATION

Design Environmental has extensive experience in the successful de-commissioning and relocation of all types of test chambers and environmental rooms both in the UK and overseas.

Taking things apart is not difficult, putting them back together again so they work reliably to their original specification, or in some cases better, is where our skill and experience counts. This service is available for single units or multiple chambers and all work is covered by warranty and traceable certification.
